

## SP3 Conservation of Energy

### Lesson sequence

1. Energy stores and transfers
2. Energy efficiency
3. Keeping warm
4. Stored energies
5. Non-renewable energy resources
6. Renewable energy resources

### 1. Energy stores and transfers

|                                       |   |
|---------------------------------------|---|
| <b>Energy</b>                         | The capacity to do work.  |
| <b>Joules</b>                         | The units of energy, symbol = J   |
| <b>Kilojoules</b>                     | 1000 J, symbol = kJ   |
| <b>Thermal energy</b>                 | Energy stored in hot objects.   |
| <b>Kinetic energy</b>                 | Energy stored in moving objects.  |
| <b>Chemical energy</b>                | Energy stored in chemicals such as fuels.   |
| <b>Nuclear energy</b>                 | Energy stored in the nucleus of atoms. Also called atomic energy.                         |
| <b>Gravitational potential energy</b> | Energy stored in objects based on how high they are.                                      |
| <b>Elastic potential energy</b>       | Also called strain energy. Energy stored in bent or stretched objects.                    |
| <b>Energy stores examples</b>         | Light, thermal( heat), sound, electrical, kinetic (movement)                              |
| <b>Law of conservation of energy</b>  | Energy cannot be created or destroyed, just transferred from one energy store to another. |
| <b>Energy transfers</b>               | Say from what store the energy starts as <i>and</i> what its new store is.                |

energy stored in moving car (kinetic energy)

→ energy transferred by forces during braking →

energy stored in hot brakes (thermal energy)

|                       |   |
|-----------------------|---|
| <b>Sankey diagram</b> | Shows energy transfers. The thickness of the arrow relates to the amount of energy. |
|-----------------------|---|

### 2. Energy efficiency

|                                  |   |
|----------------------------------|---|
| <b>Dissipation</b>               | The way energy spreads out into the surroundings, becoming less useful as it does.  |
| <b>Wasted energy</b>             | Energy that is transferred into stores that aren't useful.  |
| <b>Friction</b>                  | Causes thermal energy loss as heat when two surfaces rub together.  |
| <b>Lubrication</b>               | Allows surfaces to move smoothly, reduces energy loss from friction.  |
| <b>Electrical resistance</b>     | Causes wires to heat up, wasting electrical energy.   |
| <b>Calculating efficiency</b>    | $\text{efficiency} = \frac{\text{useful energy transferred by the device}}{\text{total energy supplied to the device}}$ Efficiency is expressed as a decimal. |
| <b>Energy efficiency numbers</b> | Efficiency is between 0 and 1.<br>1 = no energy wasted<br>0 = all energy wasted   |

### 3. Keeping warm

|   |   |
|---|---|
| <b>Convection</b>                           | Heat transfer caused when hot fluids (gas or liquid) rise because they are less dense.  |
| <b>Conduction</b>                           | Heat transfer through solids caused by vibrating particles bumping into each other.   |
| <b>Radiation</b>                            | Heat transfer by infrared radiation which heats objects up when they absorb it.   |
| <b>Radiation and surfaces</b>               | Infrared radiation is absorbed (taken in) and emitted (given out) easily by dull, dark surfaces. Radiation is absorbed and emitted poorly by shiny, light surfaces. |
| <b>Insulation</b>                           | Materials that contain lots of tiny air pockets that prevent heat loss by conduction.   |
| <b>Thermal conductivity</b>                 | A measure of how well a material conducts heat.   |
| <b>Reducing the rate of energy transfer</b> | Increase thickness of material<br>Decrease thermal conductivity<br>Decrease temperature difference  |

### 4. Stored energies

|   |  |
|---|--|
| <b>Gravitational field strength g</b>             | The strength of gravity. Different on different planets. On Earth $g = 10 \text{ N/kg}$ .  |
| <b>Calculating gravitational potential energy</b> | $GPE = mg\Delta h$ <p>GPE is gravitational potential energy (J)<br/>m is mass (kg)<br/>g is gravitational field strength (N/kg)<br/><math>\Delta h</math> is height change (m)</p> |

|                                   |   |
|-----------------------------------|---|
| <b>Calculating kinetic energy</b> | $KE = \frac{1}{2}mv^2$ <p>KE is kinetic energy (J)<br/>m is mass (kg)<br/>v is velocity (m/s)</p> |
| <b>Calculating v from KE</b>      | $v = \sqrt{\frac{2KE}{m}}$  |

### 5. Non-renewable energy resources

|                                       |   |
|---------------------------------------|---|
| <b>Non-renewable resource</b>         | A resource that will one day run out because it is being used faster than it is being made.   |
| <b>Fossil fuels</b>                   | Coal, oil, natural gas. All are non-renewable.  |
| <b>Harm from burning fossil fuels</b> | Carbon dioxide gas is released which causes global warming. Sulfur dioxide is released which causes acid rain.  |
| <b>Nuclear power</b>                  | Electricity generated from non-renewable nuclear fuels such as uranium.   |
| <b>Nuclear power pros and cons</b>    | 😊 Lasts a long time, releases no carbon dioxide<br>😞 Produces very harmful waste, expensive to decommission, although rare, accidents are very dangerous. |
| <b>Climate change</b>                 | Changes that happen to global weather patterns as a result of global warming.   |

| 6. Renewable energy resources |   |
|-------------------------------|---|
| <b>Renewable resource</b>     | A resource will not run out.  |
| <b>Wind power</b>             | Large turbines spun by the wind turn kinetic energy into electrical energy.<br>😊 No CO <sub>2</sub><br>😞 Lots needed, ugly?, no wind no power   |
| <b>Solar power</b>            | Solar cells turn light energy from the Sun into electrical energy.<br>😊 No CO <sub>2</sub><br>😞 No sun no power, need lots of space, not suitable for all countries   |
| <b>Tidal power</b>            | Uses kinetic energy from water movement from tides to spin turbines and produce electrical energy.  |
| <b>Tidal barrage</b>          | A damn built across an estuary that fills up when tide goes in. When stored water is released its kinetic energy produces electrical energy.<br>😊 Huge amounts of energy, no CO <sub>2</sub><br>😞 Destroys important mudflat habitats |
| <b>Hydroelectricity</b>       | A damn is built across a river valley, water released from the damn spins turbine and its kinetic energy produces electrical energy.<br>😊 Lots of energy, no CO <sub>2</sub><br>😞 Destroys habitat by flooding                        |
| <b>Biofuels</b>               | Fuels made from recently plant or animal matter, often waste, are a store of chemical energy.<br>😊 Carbon neutral<br>😞 Needs a lot of land, increases food prices   |

|                       |   |
|-----------------------|---|
| <b>Carbon neutral</b> | When burning a fuel releases the same CO <sub>2</sub> it absorbed when it was growing, so there is no CO <sub>2</sub> increase. |
|-----------------------|---|

| 7. Reducing energy losses (HIGHER ONLY) |  |
|---|--|
| Reducing energy losses                  | Increases the efficiency of a device or process, e.g. engines. This can be by reducing friction; by making sure all fuel is burned; or by using energy that would otherwise be wasted. |

| Lesson                                  | Memorised? |
|---|------------|
| 1. Energy stores and transfers          |            |
| 2. Energy efficiency                    |            |
| 3. Keeping warm                         |            |
| 4. Stored energies                      |            |
| 5. Non-renewable energy resources       |            |
| 6. Renewable energy resources           |            |
| 7. Reducing energy losses (HIGHER ONLY) |            |
